GENERATION OF 25 IMAGES FROM THE GENERATIVE MODEL

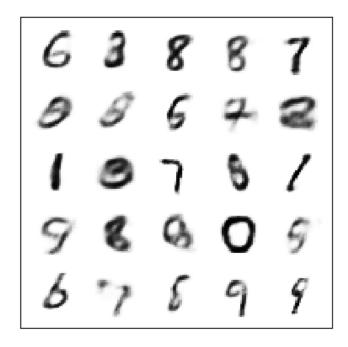

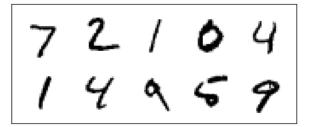

FIGURE 1 – GENERATION OF 25 IMAGES FROM THE GENERATIVE MODEL

GENERATION OF 10 IMAGE RECONSTRUCTIONS USING THE RECOGNITION MODEL AND THEN THE GENERATIVE MODEL

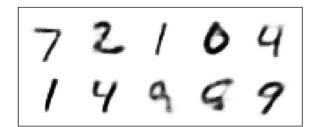

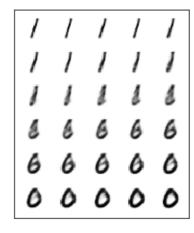

FIGURE 2 – THE RESULT OF THE RECOGNITION MODEL (LEFT)

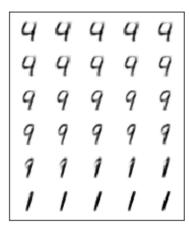

AND GENERATIVE MODEL (RIGHT)

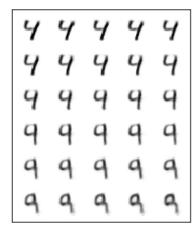

5 INTERPOLATIONS IN THE LATENT SPACE FROM ONE IMAGE TO ANOTHER

The results are provided in the figure below.

フ	7	7	7	7
7	7	7	7	7
7	7	7	7	7.
7.	2	2	2	2
2	2	2	2	2
2	2	2	2	2

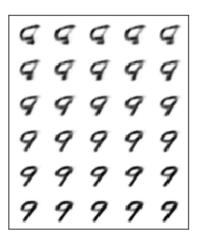

FIGURE 3 – INTERPOLATION RESULTS

Note:

to:

In order to save all interpolations to one file, the code of subtask 3.3 should be changed

```
alpha_values = np.linspace(0, 1, 30)
D = np.shape(outputs10)[-1] // 2
latent_mean = outputs10[:, :D]
vectors = []

k = 0

for i in range(5):
    for alpha in alpha_values:
        # Latent space interpolation
        vector = latent_mean[k] * (1 - alpha) + latent_mean[k+1] * alpha
        vectors.append(vector)
        preds_inter = sigmoid(neural_net_predict(gen_params, vectors))
        save_images(preds_inter, "all_interpolations")
        k = k+2
```

Then the output file will contain all interpolations in one file:

FIGURE 4 – INTERPOLATION RESULTS

Or in order to save each step to the different file:

```
alpha_values = np.linspace(0, 1, 30)
D = np.shape(outputs10)[-1] // 2
latent_mean = outputs10[:, :D]
vectors = []

k = 0

for i in range(5):
   for alpha in alpha_values:
     # Latent space interpolation
     vector = latent_mean[k] * (1 - alpha) + latent_mean[k+1] * alpha
     vectors.append(vector)
```

```
preds_inter = sigmoid(neural_net_predict(gen_params, vectors))
   save_images(preds_inter, str(i))
k = k+2
```

Then the otput files are the following:

7	7	7	7	7
7	7	7	7	7
7	7	7	7	7.
7.	7	2	2	2
2	2	2	2	2
